

Factory Activity

Module Guide: Factory Activity (Factory Activity Dashboard)

Module Location

PPIC > Factory Activity

Module Objective

The **Factory Activity** module functions as a real-time **monitoring dashboard** that provides a general overview of all activities or jobs currently in progress on the factory floor. This module groups activities by production section or area and provides quick access to see the details of ongoing jobs.

1. Main View (Activity Dashboard)

The main page of this module displays a summary of activities grouped by production section.

View Explanation & Usage

- **View:** This page is divided by **Section No.** or production area (e.g., EPRD - Cream Production, BPRD - Biscuit Production, WPRD - Water Production).
- **Current Activity Count:** This column shows the total number of jobs or documents (e.g., Work Orders) that are currently active in each section.

- **Detail:** Below this column is a list of document numbers for each ongoing activity. You can click the icon next to the document number to **drill down** and see the specific details of that job.

2. Workflow & Integrated Business Process

- This module is **read-only** and functions as a monitoring tool.
- The data displayed here is pulled in **real-time** from the **Work Order** module. Every time a Work Order is started, stopped, or completed, this dashboard will be automatically updated.

Tips & Important Notes

- Use this module to get a quick overview of the **workload in each production section** without having to open a detailed report.
- The **drill-down** feature allows you to quickly access job details if you see an anomaly or require more information about a specific activity.
- This is a crucial daily operational dashboard for **Production Managers and Supervisors** to monitor the workflow on the factory floor.
