Item Barcode

Module Guide: Item/Service Barcode (Item Barcode View)

Module Location

Inventory > Item/Service > Item/Service Barcode

Module Objective

The **Item/Service Barcode** module serves as an **inquiry screen** or a special view for seeing the list of items in the context of barcode management. This module allows users to search for and view items that have been configured with barcode settings within the system.

1. Main View (Item List)

The main page of this module displays a list of items that is similar to the main **Item/Service List** module.

View and Function Explanation

- **View**: This page displays a list of items with columns such as **Item/Service Code** and **Item/Service Name**.
- **Filter**: You can use filters like the **Item/Service Category Type Filter** (e.g., FINISHED GOODS) to screen for the items you wish to see.

- **Function**: This module most likely functions as a **read-only** view or a report. There are no buttons to create, modify, or print barcodes directly from this list page.

2. Workflow & Integrated Business Process

- **Module Nature**: This module is **informative**, not transactional.

- **Barcode Setup**: To set up, assign, or change a barcode for an item, you must do so through the main **Item/Service List** module when creating a new item (New) or editing an existing one.

- **Usage**: Use this screen to quickly check the list of items and see their settings, possibly to verify which items are ready to use a barcode system.

Tips & Important Notes

- Consider this module as a "view" or a "report", not as a tool to generate or print barcode labels.

- The functionality for printing barcode labels is most likely located in another separate module (for example, within a Reports module) or within the detail page of each item.
